MODEL EVALUATION PROCEDURES

Q: What's wrong with training error?

Thought experiment:
Suppose we train our model using the entire dataset.
Q: How low can we push the training error?

- *We can make the model arbitrarily complex (effectively "memorizing" the entire training set).*

A: Down to zero!

Q: What's wrong with training error?

Thought experiment:
Suppose we train our model using the entire dataset.
Q: How low can we push the training error?

- *We can make the model arbitrarily complex (effectively "memorizing" the entire training set).*

A: Down to zero!

NOTE

This phenomenon is called *overfitting*.

Q: What's wrong with training error?

Thought experiment:
Suppose we train our model using the entire dataset.
Q: How low can we push the training error?

- *We can make the model arbitrarily complex (effectively "memorizing" the entire training set).*

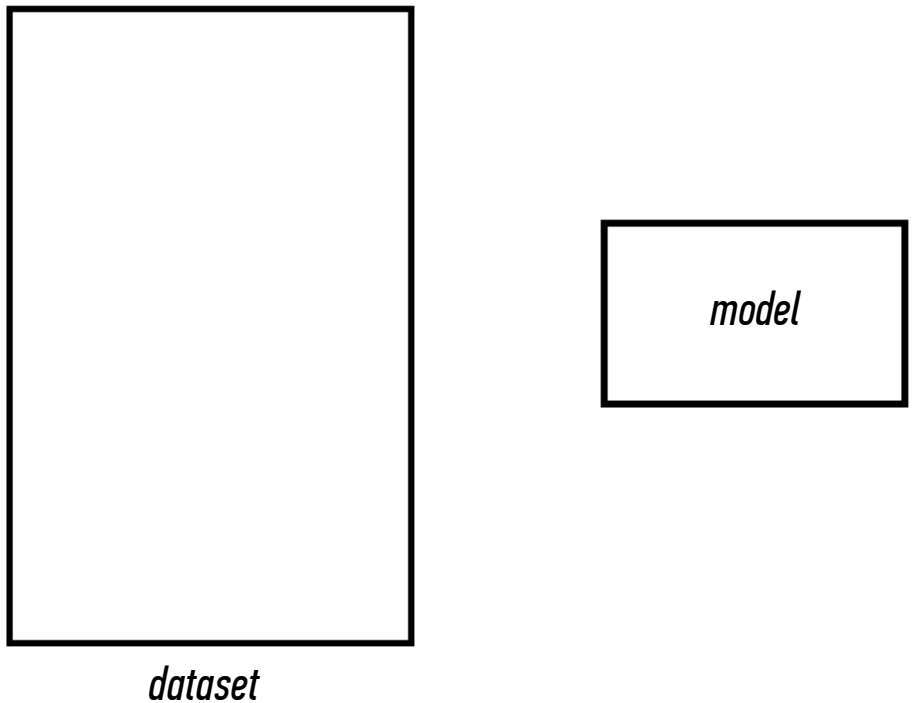
A: Down to zero!

NOTE

This phenomenon is called *overfitting*.

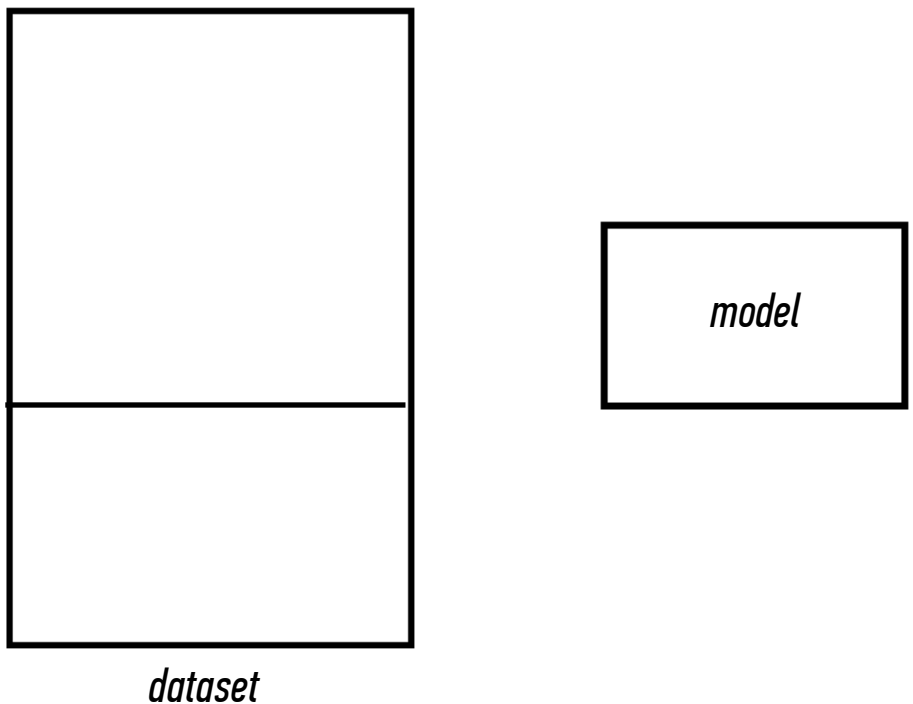
A: Training error is not a good estimate of accuracy beyond training data.

Q: How can we make a model that generalizes well?



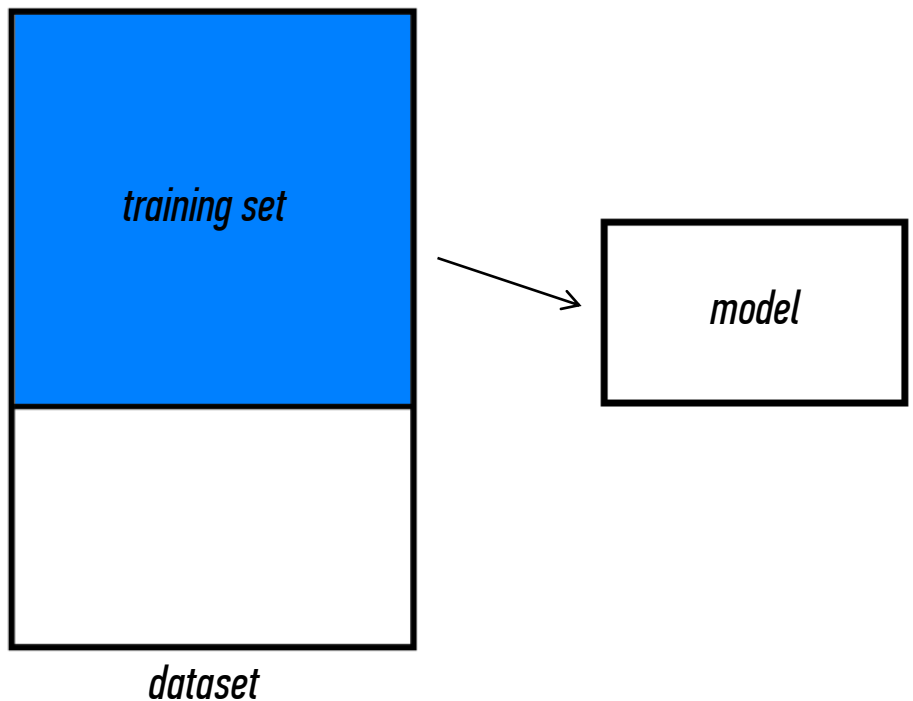
Q: How can we make a model that generalizes well?

1) split dataset



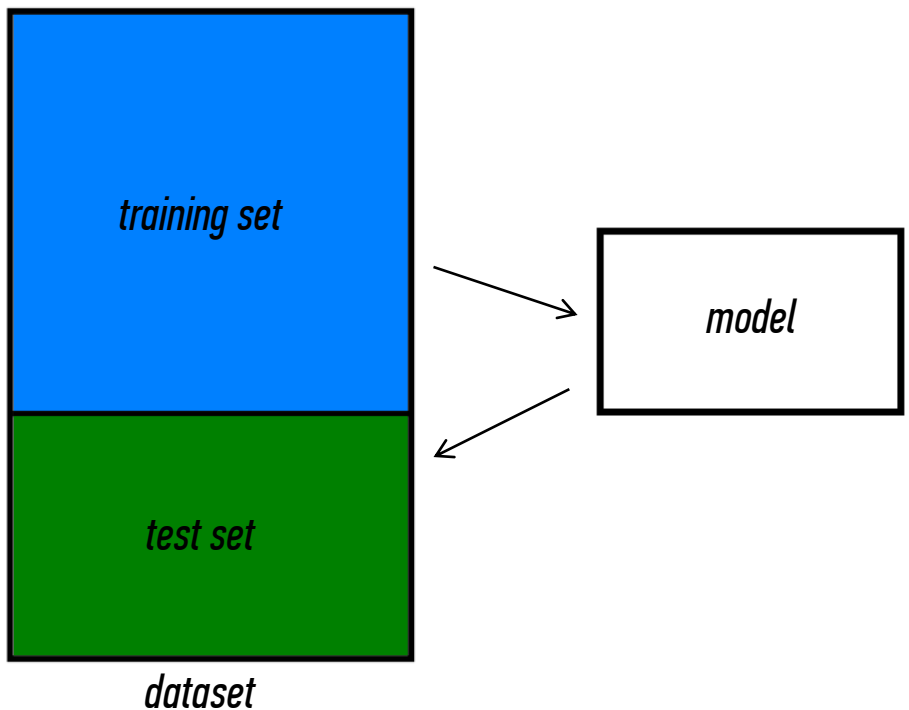
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*



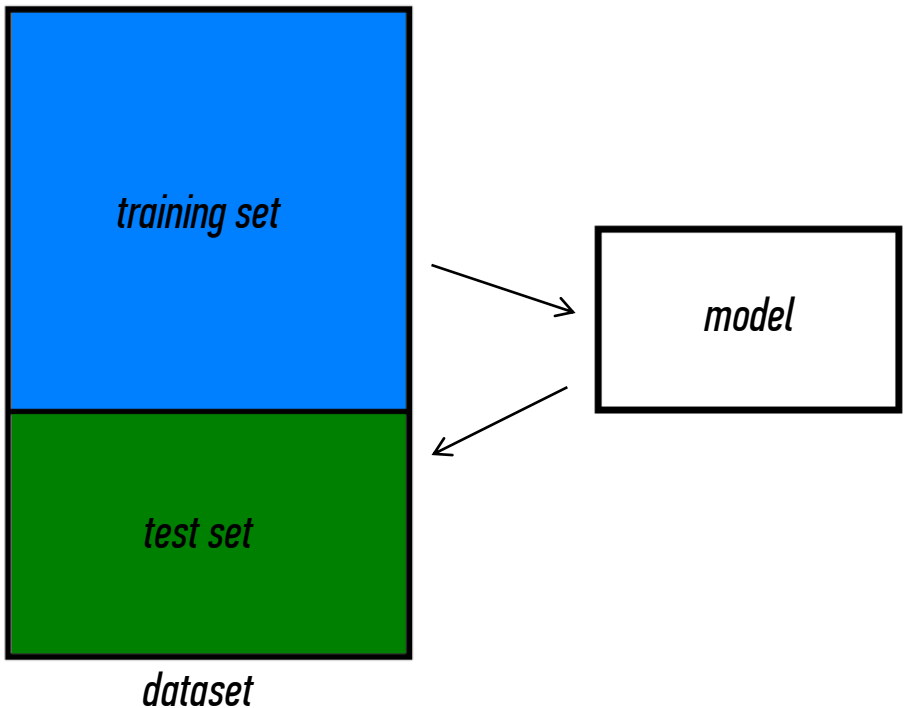
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*



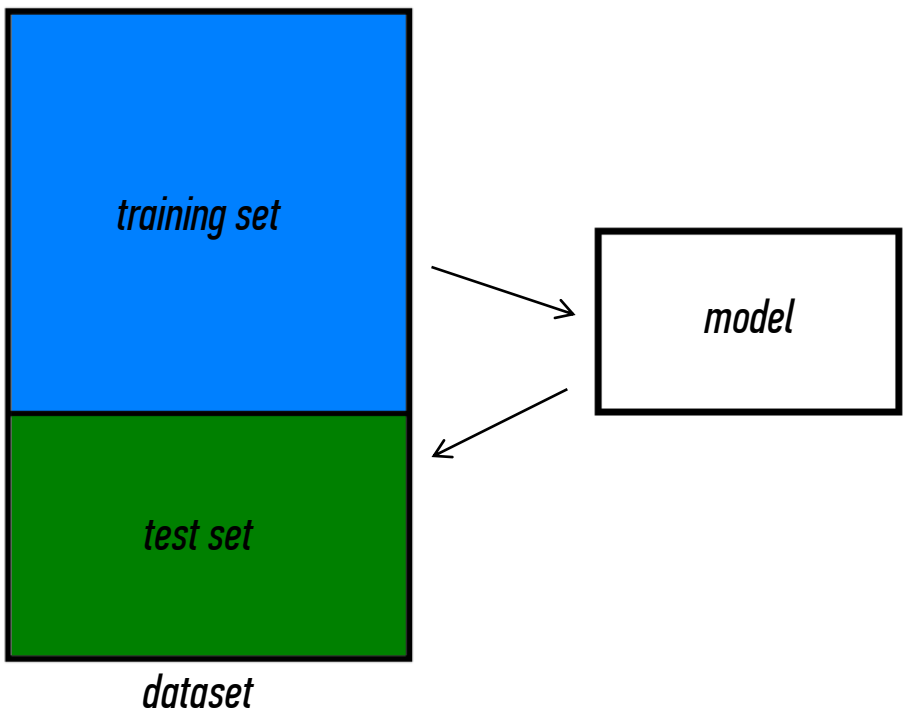
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*
4) *parameter tuning*



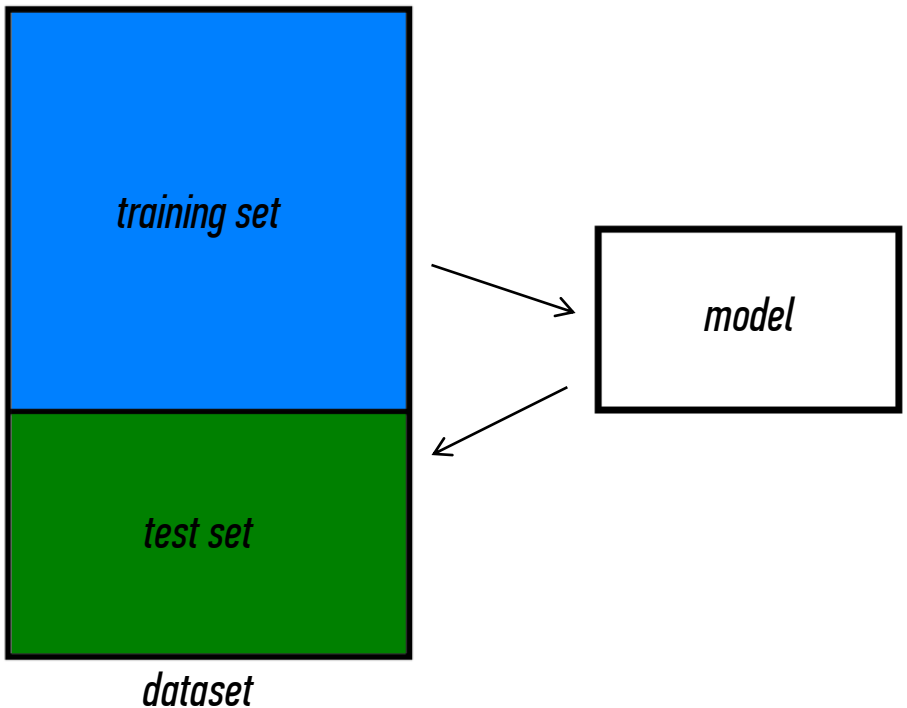
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*
4) *parameter tuning*
5) *choose best model*



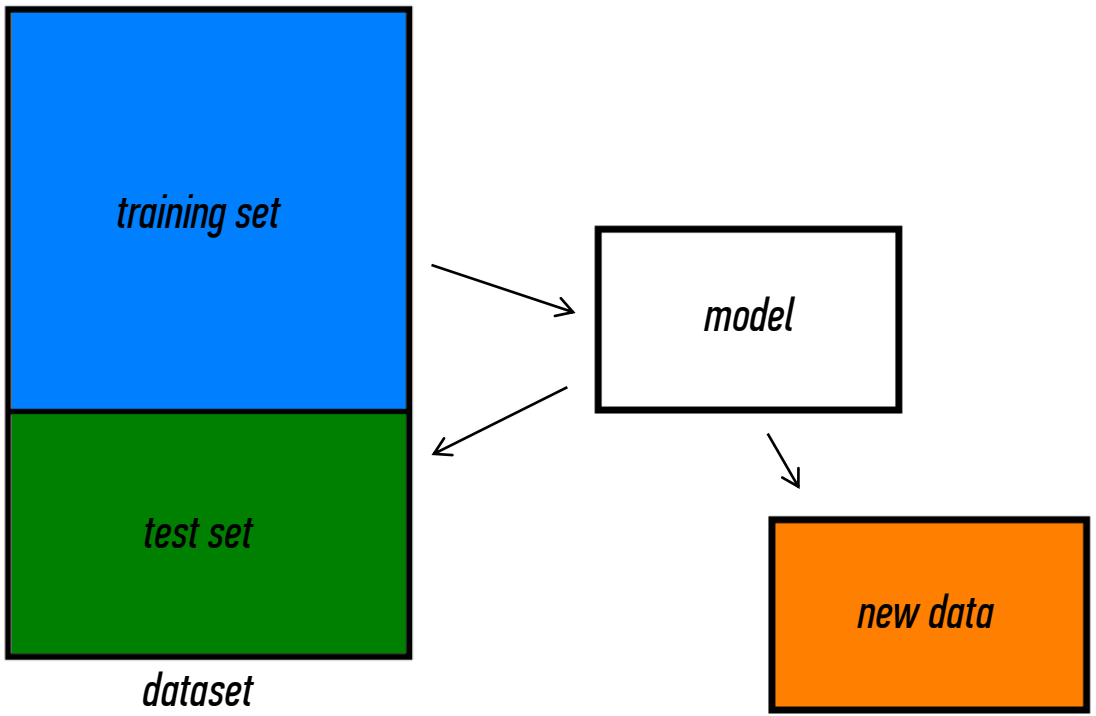
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*
4) *parameter tuning*
5) *choose best model*
6) *train on **all** data*



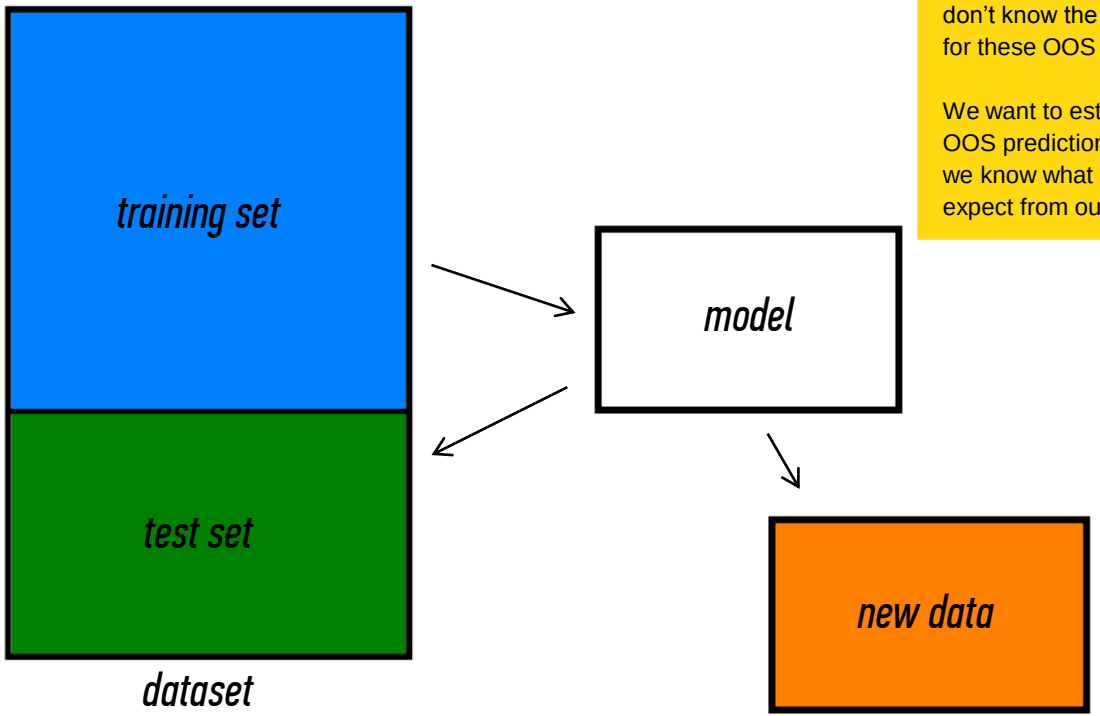
Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*
4) *parameter tuning*
5) *choose best model*
6) *train on **all** data*
7) *make predictions on new data*



Q: How can we make a model that generalizes well?

1) *split dataset*
2) *train model*
3) *test model*
4) *parameter tuning*
5) *choose best model*
6) *train on **all** data*
7) *make predictions on new data*



NOTE

This new data is called *out of sample* data. We don't know the labels for these OOS records!

We want to estimate OOS prediction error so we know what to expect from our model.

Suppose we do the train/test split.
Q: How well does test set error predict OOS accuracy?

Thought experiment:
Suppose we had done a different train/test split.
Q: Would the test set error remain the same?
A: Of course not!

A: On its own, not very well.

Suppose we do the train/test split.
Q: How well does test set error predict OOS accuracy?

Thought experiment:
Suppose we had done a different train/test split.
Q: Would the test set error remain the same?
A: Of course not!

A: On its own, not very well.

NOTE

The test set error gives a *high-variance estimate* of OOS accuracy.

Something is still missing!

Q: How can we do better?

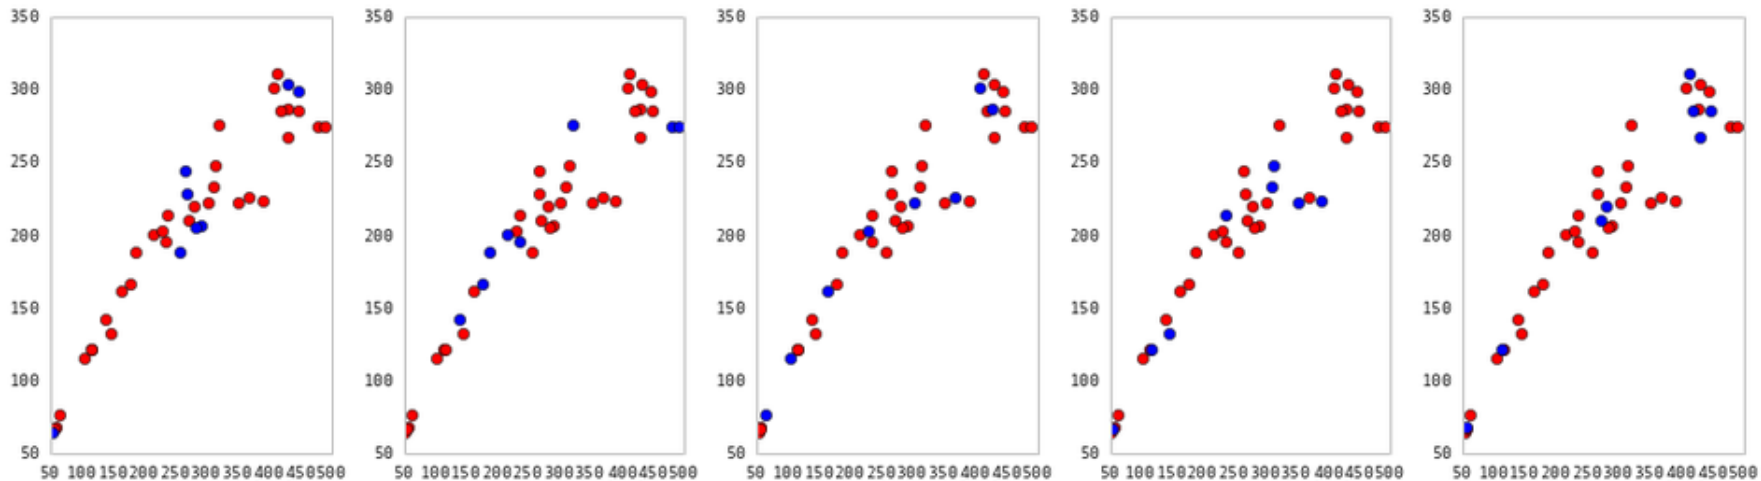
Thought experiment:
Different train/test splits will give us different test set errors.
Q: What if we did a bunch of these and took the average?
A: Now you're talking!

A: Cross-validation.

Steps for K-fold cross-validation:

1) *Randomly split the dataset into K equal partitions.*
2) *Use partition 1 as test set & union of other partitions as training set.*
3) *Calculate test set error.*
4) *Repeat steps 2-3 using a different partition as the test set at each iteration.*
5) *Take the average test set error as the estimate of OOS accuracy.*

CROSS-VALIDATION

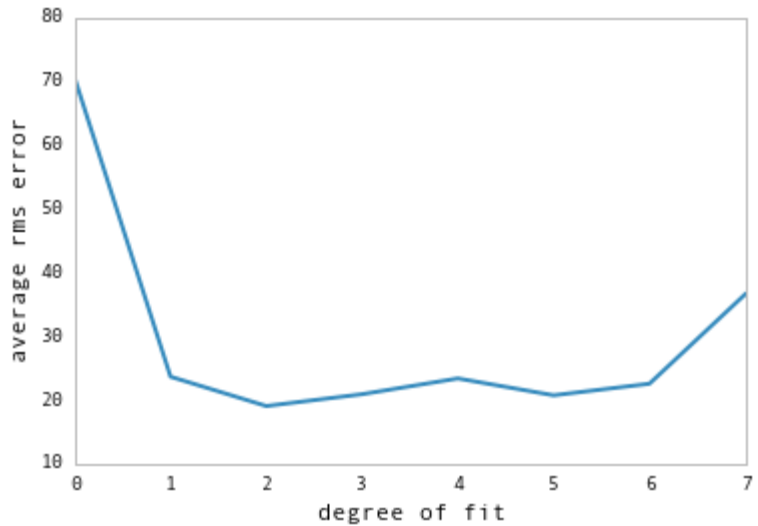


5-fold cross-validation: red = training folds, blue = test fold

Source: http://nbviewer.ipython.org/github/fonnesbeck/Bios366/blob/master/notebooks/Section6_3-Model-Selection-and-Validation.ipynb

Features of K-fold cross-validation:

1) *More accurate estimate of OOS prediction error.*
2) *More efficient use of data than single train/test split.*
    - *Each record in our dataset is used for both training and testing.*
3) *Presents tradeoff between efficiency and computational expense.*
    - *10-fold CV is 10x more expensive than a single train/test split*
4) *Can be used for parameter tuning and model selection.*



Model selection using cross-validation:
lowest predicted OOS error at degree = 2
