MODEL EVALUATION METRICS

Regression:

- *Root Mean Squared Error*

Classification:

- *Confusion Matrix*
- *ROC Curve (and AUC)*

$$\text{RMSE} = \sqrt{\frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2}$$

- *Used for regression problems*
- *Square root of the mean of the squared errors*
- *Easily interpretable (in the “y” units)*
- *“Punishes” larger errors*

$$\text{RMSE} = \sqrt{\frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2}$$

Example #1

$$y = [100, 50, 30]$$

$$\hat{y} = [90, 60, 40]$$

$$\text{RMSE} = \sqrt{\frac{10^2 + 10^2 + 10^2}{3}} = 10$$

Example #2

$$y = [100, 50, 30]$$

$$\hat{y} = [100, 50, 60]$$

$$\text{RMSE} = \sqrt{\frac{0^2 + 0^2 + 30^2}{3}} = 17.32$$

Confusion Matrix: table to describe the performance of a classifier

n=165	Predicted: NO	Predicted: YES
	Actual: NO	Actual: YES
	50	10
	5	100

Example: Test for presence of disease

NO = negative test = False = 0

YES = positive test = True = 1

- *How many classes are there?*
- *How many patients?*
- *How many times is disease predicted?*
- *How many patients actually have the disease?*

n=165	Predicted: NO	Predicted: YES	
Actual: NO	TN = 50	FP = 10	60
Actual: YES	FN = 5	TP = 100	105
	55	110	

Basic Terminology:

- *True Positives (TP)*
- *True Negatives (TN)*
- *False Positives (FP)*
- *False Negatives (FN)*

Accuracy:

- *Overall, how often is it **correct**?*
- $(TP + TN) / total = 150 / 165 = 0.91$

Misclassification Rate (Error Rate):

- *Overall, how often is it **wrong**?*
- $(FP + FN) / total = 15 / 165 = 0.09$

CONFUSION MATRIX

n=165	Predicted: NO	Predicted: YES	
Actual: NO	TN = 50	FP = 10	60
Actual: YES	FN = 5	TP = 100	105
	55	110	

False Positive Rate:

- When actual value is **negative**, how often is prediction **wrong**?
- $FP / \text{actual no} = 10/60 = 0.17$

Sensitivity:

- When actual value is **positive**, how often is prediction **correct**?
- $TP / \text{actual yes} = 100/105 = 0.95$
- “True Positive Rate” or “Recall”

Specificity:

- When actual value is **negative**, how often is prediction **correct**?
- $TN / \text{actual no} = 50/60 = 0.83$

Every email is assigned a “spamminess” score by our classification algorithm. To actually make our predictions, we choose a numeric cutoff for classifying as spam.

An ROC Curve will help us to visualize how well our classifier is doing without having to choose a cutoff!

Email Number	Score	True Label
5	0.99	Spam
8	0.82	Spam

The ROC plots the True Positive Rate (TRP) on the y-axis against the False Positive Rate (FPR) on the x-axis.

*TPR: When actual value is **spam**, how often is prediction **correct**?*

*FPR: When actual value is **ham**, how often is prediction **wrong**?*

*Q: Would the ROC Curve (and AUC) change if the **scores** changed but the **ordering** remained the same?*

*A: Not at all! The ROC Curve is only sensitive to **rank ordering** and does not require **calibrated scores**.*
